Affordable Hospital Information Systems

STAT! Patient Care integrates hospital work processes needed to provide best of class healthcare services. Automating the patient care process reduces redundant work load, miscommunications, and other mistakes that are all too common in busy health care facilities that depend on manual care delivery processes.

Electronic Medical Records

A patient's medical record is the single source clinical information for every facility in your care system. Medical records for your clinic, hospital, pharmacy, and long term care facility are maintained in one location in the system. A clinical history is recorded for each patient and becomes a permanent medical record.

Order Entry and Results Retrieval

Order Entry and Results Retrieval modules are the core for a multifaceted support system for clinical personnel. Utilizing handheld devices, the system provides point-of-care data entry and clinical results data access. The system provides physicians with remote order entry and 24-hour access to up-to-date clinical data. Order Entry links the point-of-care location to clinical departments in an effective and efficient work flow that minimizes redundant data entry for patient and charge information throughout all hospital departments.

Clinicals

- Electronic Medical Records
- Order Entry and Results Retrieval
- Medication Verification/Pharmacy
- Laboratory Information System
- Radiology
- Dietary
- Home Health
- Coming Soon – Nurses Notes

Financials

- General Ledger
- Accounts Payable
- Billing/Accounts Receivable
- Fixed Assets
- Time and Materials
- Payroll
- Barcode Inventory

Patient Accounting

- Patient A/D/T
- Insurance Processing and Billing
- Resource Scheduler
- Patient Bar Code Identification

Medication Verification / Pharmacy

Verifying medical orders and matching medication to specific patients is a critical issue to the health care industry. The *STAT!* Medication Verification module ensures safe medication administration at the point of care through the “Five Rights” process of medication management: Right Patient, Right Medication, Right Dosage, Right Route, and Right Time.

Laboratory System

Accurate, up-to-the-minute patient data and charge information. Schedule and receive orders, log specimens and retrieve results all integrated into the physician order entry system and the patient electronic medical record. View, graph and trend lab results. Streamlines sample collection and routing. Checks for duplicate and unauthorized tests or retests. Interfaces to lab equipment for direct information submission and retrieval. Allows for manual entry of Lab results for non-automated tests. Enhances lab efficiency, accuracy and productivity while ensuring that all billing information is captured.

STAT! Affordable Hospital Information Systems

STAT! Financials can manage multiple facilities within a community healthcare system. Each facility within the system can manage and report financial activity independently or results can be “rolled up” to meet consolidated reporting needs!

General Ledger

General Ledger is the core of the *STAT!* Financial module. *STAT!* incorporates industry standard charts of accounts for hospitals as well as custom charts of accounts.

Accounts Payable

Accounts Payable gives you complete control over your payment processing!

Billing/Accounts Receivable

Billing/Accounts Receivable supports multi-facility accounting with centralized billing.

Fixed Assets

Fixed Assets maintains accountability of capital assets with tracking for asset tags, location, purchase price, depreciation, salvage value and more.

Materials Management

Materials Management increases the efficiency of your materials department and promotes cost effective system-wide inventory control. *STAT!* Materials Management module is the backbone for *STAT!* Pharmacy management.

Time and Attendance

Time and Attendance supports badges and biometric finger printing, as well as wall mounted time clocks. Time entry can be performed at any designated workstation, thus eliminating the cost and effort of dedicated equipment.

Payroll

Payroll addresses the unique needs of community health care facilities. In addition to maintaining pay information, the module processes information from multiple cost centers as employees work in several departments.

STAT! Patient Services efficiently manages patient information in your organization. Features of the system include: immediate access to all patient medical and billing records, automated registration, admission, transfer, and discharge. Patient Services is fully integrated with *STAT!* Patient Care so that charges as well as diagnostic codes (ICD-9 and HPCPC) are accessible for third party and patient billing. In addition, *STAT!* incorporates specialized functions to enhance your billing operations and provide advanced reporting for management decision-making.

Resource Scheduler

At last, one scheduler meets all your scheduling needs! The *STAT!* Resource Scheduler has the flexibility to meet the specialized needs of single or multi-provider clinics, radiology and surgery. It is flexible enough to schedule even your conference rooms. The Resource Scheduler is fully integrated with *STAT!*, providing full access to your patient demographic data base.

Insurance Processing and Billing

Insurance Processing and Billing for all Medicare/Medicaid formats (including designated rural health clinics) are supported for multiple facilities. Charges and diagnostic codes are automatically posted from patient care systems, eliminating manual re-entry of data.

Patient Registration

Patient Registration is easy and efficient for in-patient, out-patient, emergency room, clinical, and long term care. Upon registration at one facility, the patient becomes “known” to all facilities within the system.
